

Upgrade Schlatter Commander

Because of technical improvements we are offering you an upgrade for the original control panel (BHG) on the Schlatter Commander. The upgrade can be applied to the following Schlatter Welders from the Systems POSIWELD Megaflex, Flex, Twinflex, Aquila, Ursa and Serpens.

Adaptation and Upgrading the Machine control

A Panel-PC for the control of the Commander, part-programming and management will be built into the existing control-cabinet. The additional monitor in the control-cabinet allows a comfortable editing of the part-programs and a secure backup management.

The new control panel offers, among other things, the following features:

- Up to date and ergonomically design
- Machine control through TFT Touch screen or keyboard
- Electronic handwheel for simple control of all NC Axes
- Creating of part-programs (Teach-In)
- Reading and backup of part-programs
- Status and error-display, as well as the reliable function of the dead man's switch

Option

The machine can be updated with a remote diagnosis function. Through a modem and an analog telephone line a PC-PC connection between the machine-control and the PC of Schlatter-support can be established.

For comprehensive information we are at your service.
