Discontinuation of the roller heads with liquid conductor for seam welding machines

«Briefanrede» «Nachname»

We hereby inform you of the discontinuation of the roller heads with mercury-containing liquid conductor, which you have acquired in connection with a machine by Schlatter for seam welding applications.

The above components have been part of the Schlatter product range since the late 1970s and were sold until 2002. Due to changes to the legal regulations by the European Parliament, the export of mercury and mercury compounds from Switzerland will be prohibited starting next year.

The relevant roller heads of the machines Selecta N and PN as well as GPN will therefore be discontinued from the end of December 2011. Until then, you have the opportunity to have the roller heads of your machine checked by us. A limited number of roll heads with liquid conductor are still available. For certain applications roller heads with power brush are obtainable. If necessary we like to clarify the choices for you.

If you would like us to make you an offer or to make an order, please call our spare parts service on T +41 (0)44 732 71 11, send a fax to F +41 (0)44 732 71 89 or send an email to ersatzteile@schlattergroup.com.

Best wishes,
Schlatter Industries AG
